The raffinose synthase can give raffinose from sucrose and galactinol efficiently. The present sequence encodes raffinose synthase from cucumber.
                                                                                                                                                                                                                                                                                     416

This is the nucleotide sequence of a mustard cDNA clone coding for raffinose synthase (see AAY32074), a protein which can bind a D-galactosyl group through an alpha(1-6) bond to the hydroxy group attached to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. The cDNA was
                                                         New sense raffinose

```

isolated from mustard (Brassica juncea) leaf cDNA by PCR. Probes or primers generated from plant raffinose synthase genes (see AAZ20207-10) may be used to obtain other raffinose synthase genes by labeled detection or amplification (claimed). These genes may labeled to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The resulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacteria, providing general health advantages. The sense and antisense genes may also be used in gene and phenotypic analysis of plants and for the selection of reference with the desired characteristics with respect to raffinose content.

The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 2498 BP; 650 A; 521 C; 673 G; 653 T; 1 other;

                               This is the nucleotide sequence of a sugarbeet cDNA clone coding for raffinose synthase (see AN332073), a protein which can bind a D-galactosyl group through an alpha(1-6) bond to the hydroxy group attached to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. The cDNA was isolated from sugarbeet cv. haming leaf cDNA by PCR. Probes or PCR primers generated from plant raffinose synthase genes (see AN220207-10) may be used to obtain other raffinose synthase genes may be used to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The cresulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacteria, providing general health advantages. The sense and antisense genes may also be used in gene and phenotypic analysis of plants and for the selection of plants clones with the desired characteristics with respect to
                                                                                                                                                                                                                                                                                                                                                                                                          30-APR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to a mutant protein of raffinose synthation which at least one aromatic amino acid present at the position of about 1-7 amino acids from the N-terminus is deleted or replaced. The mutant protein can be used for reducing the raffinose oligosaccharide content in a plant body. The present polynucleotide from soybean, was used in the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2503 TGAGTATGAAGAGAGCATGATTAAGGT

The sequence is isolated from plant material. The protein forms raffinose by complexing alpha(1 to 6)- D-galactosyl hydroxyl group of the 6C of D-glucose residue in sucrose molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim

The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides in the host organism or cell is changed. Raffinose ollgosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New nucleic acid molecule encoding plant raffinose synthetase capable of producing raffinose, used as food additives with beneficial effects on gastrointestinal flora
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

P-PSDB;
              The present sequence encodes a raffinose synthase protein. The sequence is isolated from plant material of broad beans. The protein forms raffinose by complexing alpha(1 to 6). D-galact hydroxyl group of the 6C of D-glucose residue in sucrose mole
                                                                                                                                                                                                                                                                                                                                                                                                         2444

                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                            The present sequence is a cDNA encoding raffinose synthase from clone sfil.pk125.d4 isolated from a soybean immature flower cDNA library sfil. Raffinose synthase is involved in the biosynthesis of raffinose and higher homologues in the raffinose saccharide family from sucrose. The present sequence is useful for reducing the raffinose saccharide content of soybean seeds which improves the nutritional quality of the soy protein products derived from them.
                                                                                                                                                                                                                                                                                                                                                               Claim 2;
                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acids and encoded proteins involved in the biosynthesis of raffinose, useful for producing soybean seeds with a reduced raffinose content and therefore improved nutritional quality -

The raffinose synthetase is capable of producing raffinose by combining a D-galactosyl group through an alpha (1-6) bond with a hydroxyl group attached to the carbon atom at position 6 of a D-glucose residue in a sucrose molecule. The DNA can be used to modify metabolism of a host organism by introducing into the host organism or its cell so that the content of the raffinose family oligosaccharides in the host organism or cell is changed. Raffinose oligosaccharides are useful as food additives with beneficial effects on the gastrointestinal flora.

                                                                                                                                                                                                                                                                                                             The present sequence encodes a raffinose synthase protein. The sequence is isolated from plant material. The protein forms raffinose by complexing alpha(1 to 6)- D-galactosyl hydroxyl group of the 6C of D-glucose residue in sucrose molecules.
                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 13;

These genes may be used to control the levels of raffinose produced in plants. Antisense genes can be used to knock out existing gene activity, and sense genes to increase the level of gene activity. The resulting transgenic plants may be used as a food source to alter the growing conditions for gut enterobacteria, providing general health advantages. The sense and antisense genes may also be used in gene and phenotypic analysis of plants and for the selection of plant clones with the desired characteristics with respect to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This is the nucleotide sequence of a rapesed cDNA clone coding for raffinose synthase (see AAY32075), a protein which can bind D-galactosyl group through an alpha(1-6) bond to the hydroxy groatched to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. The cDNA was isolated from rapesed cv. Westar leaf cDNA by PCR. Probes or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            밁
                                                 밁
                                                                               This is the nucleotide sequence of a soybean cDNA clone coding of raffinose synthase (see AAY3072), a protein which can bind a D-galactosyl group through an alpha[1-6] bond to the hydroxy group attached to the carbon atom at the 6-position of the D-glucose residue in a sucrose molecule to form raffinose. The cDNA was solven for soybean cv. Williams 82 immature seed cDNA by PCR. Probes or primers generated from plant raffinose synthase genes (see AAZ20207-10) may be used to obtain other raffinose synthase genes by labeled detection or amplification (claimed). These genes may be used to control the levels of raffinose produced in plants. Antisense genes to increase the level of gene activity. The and sense genes to increase the level of gene activity. The the growing conditions for gut enterobacteria, providing general chealth advantages. The sense and antisense genes may also be used in gene and phenotypic analysis of plants and for the selection of raffinose content.
